# TECHNICAL ADDENDUM
## South Carolina Hurricane Evacuation Study

As a follow-up to the transportation analysis performed for the South Carolina Hurricane Evacuation Study, several technical issues were re-examined to address specific concerns of local emergency preparedness directors. Where appropriate, new dwelling unit data (provided for some of the counties) were used to generate new evacuation statistics. Other factors were re-addressed as necessary for a particular county. Five of the nine study area counties required additional examination of technical issues regarding the transportation analysis. These counties are Hampton, Jasper, Colleton, Horry, and Georgetown Counties. This technical addendum briefly describes the technical modifications made for each of these five counties and then provides updated computer sheets of relevant evacuation statistics. The material contained within this addendum should be considered supplemental to both the Technical Data Report and Transportation Model Documentation Appendix.

## DESCRIPTION OF TECHNICAL MODIFICATIONS

### Hampton County

Census data regarding mobile homes and estimated for 1987 appeared to be only about half of the total number of mobile homes reported by Hampton County for 1986. Therefore, mobile home data was factored up on a sub-county basis so that the total number of mobile homes would equal the figure given by Hampton County. Using new mobile home data compiled by evacuation zone, new evacuation statistics were generated. The number of people evacuating dwelling units increases from 2,196 (as reported in Table 6-8 of the Technical Data Report) to 3,711. The number of vehicles evacuating dwelling units increases from 816 (as reported in Table 6-8) to 1,381. The number of Hampton County residents expected to use public shelter increases from 549 (as reported in Table 6-10 of the Technical Data Report) to 929. Updated computer sheets supporting these modifications can be found in the last sections of this addendum.

## Jasper County

As in Hampton County, census data regarding mobile homes (and estimated for 1987) appeared to be only about a half of the total number of mobile homes reported by Jasper County for 1986. Mobile home data was factored up on a sub-county basis so that the total number of mobile homes would equal the figure given by Jasper County. Using the new mobile home data compiled by evacuation zone, new evacuation statistics were generated. The number of people evacuating dwelling units increases from a range of 4,864 to 8,131 (as reported in Table 6-8 of the Technical Data Report) to a range of 6,561 to 9,827 people. The number of vehicles evacuating dwelling units increases from a range of 2,003 to 3,226 (as reported in Table 6-8) to a range of 2,637 to 3,860 vehicles. The number of Jasper County residents expected to use public shelter increases from a range of 1,216 to 2,035 to a range of 1,641 to 2,458 people. Updated computer sheets supporting these modifications can be found in the last sections of this addendum.

Most of the increased mobile home evacuees will be going to a local public shelter or the home of a friend or relative. In reviewing the critical roadway links for the county, it appears that the increased number of vehicles (coming from the mobile home areas) will be using non-critical roadway segments to get to their assumed destinations. It should be noted no modifications to Beaufort County evacuation statistics were necessary - this is important in that Beaufort County traffic is the primary contributor to critical roadway segments in Jasper County. Therefore, clearance times remain as calculated and reported in the Technical Data Report.

## Colleton County

In Colleton County, two major modifications were made to dwelling unit data. First, the number of seasonal/tourist related units was significantly increased for Edisto Beach. Secondly, the mobile home data was factored up on a sub-county basis so that the total number of mobile homes would equal the figure given by Colleton County. Incorporating these two modifications, new evacuation statistics were generated. The number of people evacuating dwelling

units increases from a range of 6,647 to 7,781 (as reported in Table 6-8 of the Technical Data Report) to a range of 11,507 to 14,738.

The number of vehicles evacuating dwelling units increases from a range of 2,719 to 3,169 (as reported in Table 6-8) to a range of 4,587 to 5,677 vehicles. The number of Colleton County residents expected to use public shelter increases from a range of 2,986 to 3,335 (as reported in Table 6-10 of the Technical Data Report) to a range of 5,210 to 5,708 people. Clearance times remain as calculated since the critical links are most influenced by Charleston County traffic. Increased mobile home evacuees will be traveling to local shelters or the home of a friend or relative on roadways away from the critical link. However, it will be extremely important to have adequate traffic control at S.R. 174 and U.S. 17 in Charleston County for Edisto Beach evacuees in order for clearance times to be valid. Updated computer sheets supporting these modifications can be found in the last sections of this addendum.

**Horry County**

For Horry County, two major modifications were tested. First, the mobile home data was factored up in the inland evacuation zones so that the total number of mobile homes would equal the figures provided by Horry County. Secondly, the number of people per seasonal/tourist unit was increased to 3.20 to account for those times of the hurricane season when "house parties" are occurring or families of four or more are present (as in the late summer vacation season).

Incorporating these two modifications, new evacuation statistics were generated. The number of people evacuating dwelling units increases from a range of 109,364 to 179,374 (as reported in Table 6-7 of the Technical Data Report) to a range of 137,967 to 199,372 people. The number of people requiring public shelter increases from a range of 29,041 to 44,701 (as reported in Table 6-9) to a range of 40,797 to 54,423 people. Clearance times remain as calculated since the increased mobile home evacuees will be traveling to local destinations on generally inland roadway segments away from the primary critical links. For traffic coming from the Grand Strand area, we would have a much higher auto

occupancy (number of people per vehicle) but about the same number of vehicles. Updated computer sheets supporting these modifications can be found in the last sections of this addendum.

**Georgetown County**

Two modifications were made for Georgetown County. First, for the high seasonal/tourist occupancy scenarios, the number of people per seasonal unit was increased to 3.2 people per unit and the number of vehicles per seasonal unit was increased to 1.75. Secondly, to acocunt for the hurricane threat situation that would occur for a rapidly developing storm where few tourists have left, the percent occupancy of seasonal units was increased to 90%.

Incorporating these two modifications, new evacuation statistics were generated. The results were as follows:

| Scenario | Number of People Evacuating Dwelling Units | Number of People to Local Public Shelter |
|---|---|---|
| Cat. 1-2/High Occ. | 27,417 | 4,626 |
| Cat. 3/High Occ. | 31,643 | 5,049 |
| Cat. 4-5/High Occ. | 46,916 | 7,098 |

It is important to note that if the tourist/seasonal population has very little time to evacuate, a higher portion may seek local public shelter on a short-term basis. This would raise the public shelter demand figure to almost 10,000 in a worst case Cat. 4-5 situation.

In examining clearance times in Georgetown County, it was evident that the behavioral response curves (assumed originally) were "masking" or hiding some of the differences that might occur between a low and high seasonal occupancy situation. In addition, the changes mentioned above needed to be considered in calculating clearance time. In calculating clearance times without using the behavioral response curve concept and incorporating the previous modifications, the following clearance times result for Georgetown County:

| | Low Tourist Occupancy | High Tourist Occupancy |
|---|---|---|
| Category 1-2 Hurricane | 4 ½ hours | 6 ¼ hours |
| Category 3 Hurricane | 5 ½ hours | 7 ¼ hours |
| Category 4-5 Hurricanes | 10 ¼ hours | 13 ½ hours |

Since the computer model clearance time program incorporates behavioral response curve data, the program was not used for this re-calculation. Times were calculated by simply dividing the updated evacuating traffic volumes by the assumed hourly flow rate (as shown in the Transportation Modeling Appendix). These calculated times show there is a significant difference between low and high seasonal occupancy clearance times if we take out the rapid, medium, or slow response concept. It should be noted that for the Category 4-5 Hurricane, the times will increase by 3-5 hours if Horry County sends a significant portion of their traffic through Georgetown County.

Updated computer sheets supporting these modifications can be found in the following sections of this addendum.
